I. Effectiveness overview
A. Why and under what conditions do nations change their behavior in response to regimes? Cannot assume compliance is same as treaty-induced compliance.
B. Terminology
   1. Implementation - passing domestic legislation for legal conformity with rules
   2. Compliance - behavior on the ground that conforms to rules
   3. Monitoring, verification, & transparency - determining whether actors are complying.
      Information from whom? Information about what? Different uses of info: Check compliance, environmental status, treaty feedback
   4. Enforcement - process by which those with incentives to not comply are nonetheless induced to do so.
   5. Effectiveness - two major ways to think about it:
C. Institutions can always be evaluated against TWO definitions of success
   1. Goal achievement:
      a) Was goal of treaty achieved ("how far from full is the glass?")
      b) Compare actual behavior (or outcomes) to stated goal
   2. Counterfactual:
      a) Is problem improved compared to no treaty? ("how far from empty is the glass?")
      b) Compare actual behavior (or outcomes) to what would have occurred otherwise
D. Institutional influence

   • Realist view: no influence of institutions

   • Institutionalist view: institutions may influence

II. Human Rights Example
A. Education of Women under CEDAW
B. How do we generate a convincing counterfactual?????
C. Members before/after – see HR example
D. Members to non-members after
E. Members to non-members before and after
F. Members regulated vs. non-regulated behavior

III. Enforcement school
A. Logic of consequences is central
B. Compliance expectation
   1. High compliance
   2. Low treaty-induced compliance -- its all coincidental compliance

© Ronald B. Mitchell, do not use without permission: http://pages.uoregon.edu/rmitchel/io/lectures/13-InstitutionalEffectiveness-Part1.docx
3. Unlikely to influence any states but members

C. Why and when do states comply?
   1. Voluntariness of international institutions:
      a) Countries that become members of a treaty are those that already planned on changing behavior as required
      b) Members differ from non-members in terms of "willingness to comply"
   2. Shallow cooperation: not much is required of them
      a) Collaboration games
      b) Changes in behaviors that are already planned
      c) States sign agreements to ratify already planned decreases.
         (1) "There is a remarkable compatibility between the [SALT] Treaty limitations and the projected strategic nuclear weapons programs of both sides." (Goldblat in Downs, Rocke and Barsoom in SM, 290).
         (2) "The Montreal Protocol was enacted because it codified reductions in CFC emissions that polluters were voluntarily prepared to accomplish" (Barrett in DRB in SM, 291).

D. Why and when do states violate?
   1. Whenever it is in their short-term interests to do so
   2. Violate rules, i.e., don't change their behavior, if it isn't in their short-term interests
   3. Violations reflect a very deliberate calculation of interests, using a logic of consequences
   4. Violate with little regard to legal requirements and norms
   5. **Intention:** Violate because:
      a) Disagree that there is a problem that deserves collective action
      b) Agree there is a problem but want to "free-ride" on contributions of others
      c) Want to overturn institutional rules and norms: behave contrary to normative rules in order to undermine and weaken them. Disagree with norm and roles and want to re-construct new norms and roles more to their liking. E.g.: Norway and Iceland violations of whaling regime to demonstrate their belief that whaling is morally okay

IV. Management school
   A. Logic of appropriateness is important but logic of consequences ALSO plays a role
   B. Compliance expectation
      1. Hard to tell about compliance levels because terms are often so vague
      2. High compliance, if one can tell
      3. High treaty-induced compliance, at least if institution properly designed
      4. May even influence non-members
   C. Why and when do states comply?
      1. Because they are in their interests
      2. *Pacta sunt servanda* - general norm that, if you sign a treaty voluntarily, you should do what you said you would
      3. States don't continuously re-calculate their interests -- once states decide to comply, they don't constantly re-evaluate whether it's a good idea (this is Chayes and Chayes "efficiency" argument - it is "efficient" to comply in terms of making decisions)
      4. Habit of complying
      5. Whenever enough other states are complying so there is "critical mass" if benefits of compliance by others outweighs costs to you of contributing, then comply -- assumes that states believe others' behaviors are contingent on theirs and will take risks to avoid problems due to that
      6. Expectations and normative pressure from other states and within own state: voluntarily agreed to comply, so you should, say other countries and your own polity
   D. Why and when do states violate?
      1. Not very often
      2. Ambiguity of treaties leads violating state to interpret it in a way that others view as violations
      3. **Incapacity:** Lack capacity to comply: scientific, technical, bureaucratic, and financial
      4. **Inadventerence:** Try to comply but fail because of inadvertence or changes in economic or social circumstances
      5. Only violate after careful consideration of treaty requirements

V. Effectiveness of institutions
A. **Where** to look: How do we observe the effects of a treaty - what are the proper metrics or indicators of effects?

B. **How** to look: How do we identify the "counterfactual" of the world without the treaty, or with the treaty but without the particular feature of the treaty (e.g., financial incentives)?
   1. Compare **after** to **before** for member countries
   2. Compare **members** to **non-members** after
   3. Compare **regulated** behavior of members to **non-regulated** behavior of members

C. **Is there a difference?** What were the effects of each treaty?
   1. COUNTERFACTUAL: counterfactual is the estimate (based on available evidence) of what would have happened without an agreement (or other causal factor) that is used to evaluate the argument regarding whether the agreement made a difference. **If the line you generate as your counterfactual line is identical to your "observed data" line, then your argument must be that the agreement did not make a difference.** Note that a counterfactual is therefore simply part (a usually implicit part) of the same theory you are evaluating. Thus, the argument that "this treaty made a difference" is supported by building an argument that the counterfactual line looks different than the line we actually observed.

D. **Is difference due to treaty?** What other factors might have caused changes?
   1. ALTERNATIVE EXPLANATION or RIVAL HYPOTHESIS: an "alternative explanation" or "rival hypothesis" is NOT the same as a counterfactual. An alternative explanation (or rival hypothesis, they mean the same thing) is an argument that takes the form of "no, it’s not the treaty that made the difference but something else." For example, an alternative explanation of a treaty on landmines might argue that "yes, there is a reduction in the number of landmines being used by the countries of the world, and it did occur after the landmines treaty was signed BUT that reduction in landmine use is NOT due to the landmine treaty but is due to the fact that technology advanced so that it was more effective to use hand grenades rather than landmines." You address an alternative explanation by saying, "well, some people would say that the decline in landmines is due to the availability of very sophisticated hand grenades which were cheaper anyway, and so it was the availability of a lower cost alternative to landmines rather than a treaty banning them that explains the decline in landmine use. HOWEVER, this argument is wrong because in the ten years since the landmine treaty was signed, handgrenades have been even more expensive than they were before whereas landmines have gotten even cheaper than they were before. So, this alternative explanation is false."
   2. What was the problem structure that the Montreal Protocol was addressing? Did that dictate the terms of the regime as well as any behavioral change that occurred?
   3. Were there any economic downturns or development of cheaper alternatives that might explain the change in behavior?
   4. Were there any changes in political pressures that might have led to changes in behavior even without the treaty adopting financial incentives?

E. **Is the difference impressive?** Was it an easy problem or a hard problem to resolve?

VI. Conclusions
   A. How do we evaluate the effects of a treaty on behavior?
   B. How do we account for differences in problem structure?
   C. How do we account for differences in regime design and features?
   D. This is a lot to cover in a short time but provides a background for thinking about how to do the analysis of this course.
